

Title: Why we do need explainable AI for healthcare.

Summary:

This article is talking about explainable AI in healthcare system. It says that we can use AI for good. It is a trust worthy, transformative and transparent for healthcare system. AI can solve complex data types. There are some issues of using AI tools like usefulness and efficiency. We want AI can behave like human beings, give human understandable thought and better performance. This creates a conflict. This article is talking about seven criticisms. There are also talking about black-box models. It is very dangerous if we use it scale without human oversight. Explainable AI is presented as a way to preserve clinician judgment, maintain accountability, healthcare prevention and so on. It is also pointed that explanation must be match to the user because developers and clinicians don't all need the same information. Another important point is different healthcare system need different levels of explanation. For some tasks, such as image reconstruction in the background, explain ability may matter less. For high level tasks like diagnosis, risk prediction, or treatment support, explanations can help clinicians detect bias, check whether a model is using sensible signals, and decide when not to trust an output. The paper also stresses that explain ability should complement, not replace. There are also a various types of techniques like global Vs local and model-specific vs. model-agnostic. This models generate explanation for black-box model. At last the article says the use of explainable AI is increasing day by day. It suggests that we have to continue research in explainable AI because transparency is important for trust, fairness, safety and responsible clinical use.
